MOI FORGE HACKS

Build the Future of Participant-Centric Blockchain

Mini-Hackathon | March 2026

What is a Blockchain?

Shared Ledger

A database that many computers keep in sync — no single owner, no single point of failure.

Trust Without Middlemen

Math (cryptography) replaces banks, notaries, and gatekeepers. Code is the law.

Immutable History

Once recorded, data can't be altered. Every action leaves a permanent, auditable trail.

Think: Google Docs, but for money — and nobody can delete your edits.

How Blockchain Works

Block 0	Block 1	Block 2	Block 3
Hash: 0x0000	Hash: 0xa3f1	Hash: 0xb7c2	Hash: 0xd4e8
Prev: —	Prev: 0x0000	Prev: 0xa3f1	Prev: 0xb7c2
Nonce: —	Nonce: 28471	Nonce: 91035	Nonce: 55218
Data: Genesis	Data: 3 txns	Data: 5 txns	Data: 2 txns

Each block stores a hash of the previous block — forming an immutable chain.

Smart Contracts

Programs on the blockchain — like vending machines: put money in, something comes out.

Transactions

How you talk to a contract. Fire and forget — the contract doesn't know who you are.

Global State

Everyone shares one state. 1,000 users? All balances live in one contract.

What is MOI?

A blockchain that remembers who you are.

Traditional Blockchains

- You are just an address
- Your data is scattered across contracts
- No memory between interactions
- Agents start from zero every time

MOI

- You are a participant with rich identity
- Your state lives with you, always
- Full context in every interaction
- Agents carry memory and reputation

MOI gives every participant — human or AI — a persistent, portable context that the network understands.

Why MOI for AI Agents?

AI agents need memory, identity, and context to operate autonomously.
Existing blockchains don't provide any of this. MOI does.

1 **Persistent Memory**
Agent state persists across sessions. The network remembers — no need to reconstruct context from scratch every time.

2 **Portable Identity**
An agent's reputation, history, and permissions travel with it across any logic or protocol on MOI. One identity, everywhere.

3 **Intent-Native Execution**
Agents express what they want to do, not just which function to call. The network processes interactions with full participant context.

On MOI, AI agents are first-class participants — not second-class scripts.

Ethereum's Problem

The contract is the bank. You don't own your tokens — the contract SAYS you own them.

```
// ERC20 — Contract-Centric

mapping(address => uint256) _balances;

function transfer(to, amount) {
  _balances[msg.sender] -= amount;
  _balances[to]         += amount;
}

// Two rows in a spreadsheet change.
// Nothing actually "moved."
```

Contract-Centric
Your balance lives inside the contract, not with you.

Identity = msg.sender
Just an address. No history, no context, no reputation.

Transfers = Ledger Edits
Numbers change in a spreadsheet. Nothing moves.

Scattered State
10 tokens = 10 contracts holding your data.

MOI: Participant-Centric

On MOI, YOU are the bank. State lives with YOU, not inside a contract.

```
// MAS0 Token — Cocolang

coco Asset
state persistent:
    balance U64

endpoint invokable Transfer(to, amount):
    mutate bal <- Asset.State.balance
    bal = bal - amount
    mutate bal -> Asset.State.balance

// YOUR state. YOUR balance. YOUR control.
```

Participant-Centric
State lives WITH you. Your balance is yours, always.

Rich Identity
MOI knows who you are — history, reputation, context.

True Ownership
Tokens actually move between participants.

Unified State
All your assets in one place — your participant state.

LIVE DEMO

Full-Stack MOI dApp

1. Cocolang logic walkthrough (asset.coco)
2. js-moi-sdk deploy script
3. Live deploy to MOI testnet
4. Frontend: Mint & Transfer between participants

Voyage: MOI Explorer & Faucet

Your toolkit for building on MOI testnet

Block Explorer

- Browse tesseracts, interactions, and logics
- See participant state in real time
- Inspect logic deployments & calls

voyage.moi.technology

Testnet Faucet

- Free testnet COCO tokens for development
- Connect wallet and claim instantly
- Fuel your interactions on testnet

voyage.moi.technology/faucet

Docs & Resources

Cocolang Docs

Language reference, tutorials, and examples for writing MOI logics

cocolang.dev

js-moi-sdk

JavaScript SDK for wallets, providers, logic deployment & interaction

js-moi-sdk.docs.moi.technology

MOI Docs

Core concepts — participant-centricity, PISA, ISM, tesseracts

docs.moi.technology

GitHub Repos

Open source examples, starter templates, and SDK source code

github.com/moi-technology

Hackathon Tracks

Pick a track. Build on MOI. Ship by March 31.

01

DEX

Decentralized Exchange

Build a token swap on MOI using participant-centric state. AMM, order book, or your own design — leverage participant identity to make trading smarter.

Study: Uniswap, Curve, SushiSwap

Build on MOI

02

DAO

Decentralized Governance

Build a governance system on MOI where voting power comes from participation, not just token holdings. Proposals, voting, execution — all participant-centric.

Study: Compound Governor, Aragon, Snapshot

Build on MOI

03

Bridge

Cross-Chain Bridge

Build a bridge between MOI and another chain. Design a mechanism where participant-centric state makes cross-chain transfers safer and more trustworthy.

Study: Wormhole, LayerZero, Axelar

Build on MOI

Timeline & Rules

Mar 17
Kickoff
Presentation + Demo
Join Discord today

Mar 17–31
Build Phase
2 weeks to build
Discord office hours

Mar 31
Submission
GitHub repo + README
2-min demo video

Submission Requirements

- Public GitHub repo with all source code
- README: problem, approach, how to run, team members
- 2-minute demo video (screen recording is fine)
- Pick one of the 3 tracks: DEX, DAO, or Bridge

What's Next?

This hackathon isn't just a competition — it's a pipeline.

1

Win the Hackathon

Ship your project by March 31. Top teams from each track (DEX, DAO, Bridge) get selected.

2

Join MOI Forge

Winners enter MOI Forge — a focused incubator program working directly with the MOI core team. Build your project into a real protocol-level product with mentorship, resources, and technical guidance.

3

Internships & Full-Time Roles

Top Forge participants get fast-tracked for internships and full-time positions at Sarva Labs, the team building MOI. Prove yourself in the hackathon, grow in the incubator, join the team.

Hackathon → Incubator → Team

MOI Forge

A 12-week incubator to build real products on MOI.

12 Weeks, Hands-On
Work directly with MOI protocol engineers to develop production-grade applications on the MOI network.

Mentorship & Resources
Weekly sessions with core team members. Access to internal tools, documentation, and testnet infrastructure.

Global Cohort
Collaborate with students from top universities and international companies. Build your network while building on MOI.

Career Pipeline
Top performers get fast-tracked for internships and full-time roles at Sarva Labs — the team behind MOI.

Past & Current Batches

- Purdue University
- University of Oxford
- Stanford University
- IIT Delhi
- MIT

Work With Global Partners

Forge participants collaborate with international universities, research labs, and industry partners building on participant-centric infrastructure.

Win the hackathon. Join the Forge. Build the future.

Join the Discord

Ask questions. Find teammates. Get office hours.
